

1. To install Git on a Mac, you must first install Homebrew or download the installer from the Git website. Once installed, open the Terminal and type "git config" to add your global user information. Download and run the Git installer for PC from the official website. Continue by adding Git to your system PATH, and then open the Git Bash terminal and use "git config" to enter your global user details. Set up SSH keys using the "ssh-keygen" command to use a public key for security and protection, then add it to your Git hosting provider.
- 2.
